ABSTRACT

This study aims to find the relationship between religiosity and academic stress. This quantitative research used simple random sampling technique which was analyzed by 21st version of SPSS program with correlation test from product moment Pearson. The subjects were psychology's last year students from Muhammadiyah University of Sidoarjo with 358 people as population and 234 people as sample. This study used two psychological scales, CSR scale (Center of Religiosity Scale) to measure religiosity and the ESSA (Educational Stress Scale for Adolescents) to measure academic stress. Both of them are Likert scales. The results of data analysis were obtained by the value of $r = 0.294$ with a significant value of 0.000 ($P < 0.05$) means that H_0 is accepted because there is a correlation between religiosity and academic stress. The implications of this study through the calculation of R square, the religiosity factor contributes to overcoming academic stress by 8.6% in last year students from psychology study program in Muhammadiyah University of Sidoarjo, while the rest was influenced by other factors.

Keywords : Academic Stress, Psychology, Religiosity, Stress, Student.

Dikomentari [B1]: Please, use a consistent word or sentence between the title and the content!

Dikomentari [B2]: please, use a consistent word or sentence between the title and the content!
