The influence of self-concept and peer support on social anxiety of stutter survivors in Indonesia

Nanda Fajriah Azzari, Lely Ika Maryati, Dwi Nastiti

Abstract

Stuttering is a speech disorder characterized by repeating sounds, syllables, or prolonging sounds. Individuals with a stutter know precisely what they want to say but have difficulty producing a regular flow of speech. Stuttering, which may be accompanied by behaviors such as rapid eye blinking or lip trembling. This study aims to determine the relationship between self-concept and peer support with social anxiety in stutter survivors in the Indonesia Stuttering Community. The sample for this study was 209 members of the Indonesia Stuttering Community out of a population of 537 members. The sample was selected using a purposive sampling technique with criteria of individual who have speech disorders (stuttering) and are part of the ISC community. Data collection uses three psychological scale, namely self-concept scale, peer support scale and social anxiety scale. The result of this study indicate that the effective contribution value is 46.1%. It can be concluded that there is an influence between self-concept and peer support on social anxiety among stuttering survivors who are part of the ISC community.

Keywords

Indonesia stuttering community; peer social support; self-concept; social anxiety; stutter
